# **Chapter 2**

## **(Part 2)**

# **Functions**

- Let  $X$  and  $Y$  be nonempty sets
- A function  $f$  from  $X$  to  $Y$  is a relation from  $X$  to  $Y$  having the properties.
  - The domain of  $f$  is  $X$
  - If  $(x, y), (x, y') \in f$ , then  $y = y'$

(e.g.  $f(1)=b, f(2)=b$  is a function, but  $f(1)=a, f(1)=b$  is NOT a function)

# Functions

- A function from  $X$  to  $Y$  is denoted,  $f: X \rightarrow Y$
- The domain of  $f$  is the set  $X$ .
- The set  $Y$  is called the codomain or target of  $f$ .
- The set  $\{ y \mid (x,y) \in f \}$  is called the range.

## example

- The relation,  $f = \{ (1,a), (2,b), (3,a) \}$  from  $X = \{ 1, 2, 3 \}$  to  $Y = \{ a, b, c \}$  is a function from  $X$  to  $Y$ .
- The domain of  $f$  is  $X$
- The range of  $f$  is  $\{a, b\}$

## example

■  $f = \{ (1,a), (2,b), (3,a) \}$

prepared by Razana Alwee

## example

- The relation,  $R = \{(1,a), (2,a), (3,b)\}$  from  $X = \{1, 2, 3, 4\}$  to  $Y = \{a, b, c\}$  is NOT a function from  $X$  to  $Y$ .
- The domain of  $R$ ,  $\{1, 2, 3\}$  is not equal to  $X$ .

## example

$$R = \{(1,a), (2,a), (3,b)\}$$

There is no arrow from 4

## example

- The relation,  $R = \{(1,a), (2,b), (3,c), (1,b)\}$  from  $X = \{1, 2, 3\}$  to  $Y = \{a, b, c\}$  is NOT a function from  $X$  to  $Y$
- $(1,a)$  and  $(1,b)$  in  $R$  but  $a \neq b$ .

## example

$$R = \{(1,a), (2,b), (3,c), (1,b)\}$$

There are 2 arrows  
from 1

- For the function,  $f = \{(1,a), (2,b), (3,a)\}$
- We may write
$$f(1)=a, \quad f(2)=b, \quad f(3)=a$$
- Notation  $f(x)$  is used to define a function

■  $f(x) = x^2$

$$f(2) = 4, \quad f(-3.5) = 12.25, \quad f(0) = 0$$

$$f = \{(x, x^2) \mid x \text{ is a real number}\}$$

## One-to-one

- A function  $f$  from  $X$  to  $Y$ , is said one-to-one (or injective) if for each  $y \in Y$ , there is at most one  $x \in X$ , with  $f(x)=y$ .
- For all  $x_1, x_2$ , if  $f(x_1) = f(x_2)$ , then  $x_1=x_2$ .  
$$\forall x_1 \forall x_2 ((f(x_1) = f(x_2)) \rightarrow (x_1=x_2))$$

## example

- The function,  $f = \{ (1,b), (3,a), (2,c) \}$  from  $X = \{ 1, 2, 3 \}$  to  $Y = \{ a, b, c, d \}$  is one-to-one.

Each element in  $Y$  has at most one arrow pointing to it

prepared by Razana Alwee

## example

- The function,  $f = \{ (1,a), (2,b), (3,a) \}$  from  $X = \{ 1, 2, 3 \}$  to  $Y = \{ a, b, c \}$  is NOT one-to-one.
- $f(1) = a = f(3)$

## example

$$f = \{ (1,a), (2,b), (3,a) \}$$

$a$  has 2 arrows  
pointing to it

Show that the function,

$$f(n) = 2n+1$$

on the set of positive integers is one-to-one.

## example

- For all positive integer,  $n_1$  and  $n_2$  if  $f(n_1) = f(n_2)$ , then  $n_1 = n_2$ .
- Let,  $f(n_1) = f(n_2)$ ,  $f(n) = 2n+1$   
then  $2n_1 + 1 = 2n_2 + 1$   $(-1)$   
 $2n_1 = 2n_2$   $(\div 2)$   
 $n_1 = n_2$
- This shows that  $f$  is one-to-one.

- Show that the function,

$$f(n) = 2^n - n^2$$

from the set of positive integers to the set of integers is NOT one-to-one.

- Need to find 2 positive integers,  $n_1$  and  $n_2$   
 $n_1 \neq n_2$  with  $f(n_1) = f(n_2)$ .
- Trial and error,  
$$f(2) = f(4)$$
- $f$  is not one-to-one.

## Onto

- If  $f$  is a function from  $X$  to  $Y$  and the range of  $f$  is  $Y$ ,  $f$  is said to be onto  $Y$   
(or an onto function or a surjective function)

- For every  $y \in Y$ , there exists at least one  $x \in X$  such that  $f(x)=y$

$$\forall y \in Y \exists x \in X ( f(x)=y )$$

- The function,  $f = \{ (1,a), (2,c), (3,b) \}$   
from  $X = \{ 1, 2, 3 \}$  to  $Y = \{ a, b, c \}$   
is one-to-one and onto  $Y$ .

## example

■  $f = \{ (1,a), (2,c), (3,b) \}$

**One-to-one**  
Each element  
in  $Y$  has at  
most one  
arrow

**Onto**  
Each element  
in  $Y$  has at  
least one  
arrow  
pointing to it

prepared by Razana Alwee

## example

- The function,  $f = \{ (1,b), (3,a), (2,c) \}$   
is not onto  $Y = \{a, b, c, d\}$
- It is onto  $\{a, b, c\}$

## example

$$f = \{ (1,b), (3,a), (2,c) \}$$

**not onto**  
no arrow  
pointing to  $d$

# Bijection

- $f$  is called one-to-one correspondence (or bijective or bijection) if  $f$  is both one-to-one and onto.

- The function,  $f = \{ (1, \alpha), (2, \theta), (3, \beta) \}$   
from  $X = \{ 1, 2, 3 \}$  to  $Y = \{ \alpha, \beta, \theta \}$   
is one-to-one and onto  $Y$ .
- The function  $f$  is a bijection

## example

$$f = \{ (1, \alpha), (2, \theta), (3, \beta) \}$$

One-to-one  
and onto  $Y$   
**-bijection**

prepared by Razana Alwee

Determine which of the relations  $f$  are functions from the set  $X$  to the set  $Y$ .

a)  $X = \{-2, -1, 0, 1, 2\}$ ,  $Y = \{-3, 4, 5\}$  and

$f = \{(-2, -3), (-1, -3), (0, 4), (1, 5), (2, -3)\}$

b)  $X = \{-2, -1, 0, 1, 2\}$ ,  $Y = \{-3, 4, 5\}$  and

$f = \{(-2, -3), (1, 4), (2, 5)\}$

c)  $X = Y = \{-3, -1, 0, 2\}$  and

$f = \{(-3, -1), (-3, 0), (-1, 2), (0, 2), (2, -1)\}$

In case any of these relations are functions, determine if they are one-to-one, onto  $Y$ , and/or bijection.

# Inverse function

- Let  $f: X \rightarrow Y$  be a function.
- The inverse relation  $f^{-1} \subseteq Y \times X$  is a function from  $Y$  to  $X$ , if and only if  $f$  is both one-to-one and onto  $Y$ .

## example

■  $f = \{(1,a),(2,c),(3,b)\}$

■  $f^{-1} = \{(a,1),(c,2),(b,3)\}$

## example

prepared by Razana Alwee

## example

- The function,  $f(x) = 9x + 5$  for all  $x \in R$  ( $R$  is the set of real numbers).
- This function is both one-to-one and onto.
- Hence,  $f^{-1}$  exists.
- Let  $(y, x) \in f^{-1}$ ,  $f^{-1}(y) = x$   
 $(x, y) \in f$ ,  $y = 9x + 5$   
 $x = (y-5)/9$   
 $f^{-1}(y) = (y-5)/9$

■ Find each inverse function.

a)  $f(x) = 4x + 2, x \in R$

b)  $f(x) = 3 + (1/x), x \in R$

- Suppose that  $g$  is a function from  $X$  to  $Y$  and  $f$  is a function from  $Y$  to  $Z$ .

- The composition of  $f$  with  $g$ ,

$$f \circ g$$

is a function

$$(f \circ g)(x) = f(g(x))$$

from  $X$  to  $Z$

## example

- Given,  $g = \{ (1,a), (2,a), (3,c) \}$   
a function from  $X = \{1, 2, 3\}$  to  $Y = \{a, b, c\}$  and  
 $f = \{ (a,y), (b,x), (c,z) \}$   
a function from  $Y$  to  $Z = \{ x, y, z \}$
- The composition function from  $X$  to  $Z$  is the function  
 $f \circ g = \{ (1,y), (2,y), (3,z) \}$

# example

prepared by Razana Juma

## example

■  $f(x) = \log_3 x$  and  $g(x) = x^4$

$$f(g(x)) = \log_3(x^4)$$

$$g(f(x)) = (\log_3 x)^4$$

Note:  $f \circ g \neq g \circ f$

## example

$$f(x) = \frac{1}{5}x$$

$$g(x) = x^2 + 1$$

$$(g \circ f)(x) = g(f(x)) = g\left(\frac{x}{5}\right)$$

$$= \left(\frac{x}{5}\right)^2 + 1 = \frac{x^2}{25} + 1$$

- Composition sometimes allows us to decompose complicated functions into simpler functions.

- example

$$f(x) = \sqrt{\sin 2x}$$

$$g(x) = \sqrt{x} \quad h(x) = \sin x \quad w(x) = 2x$$

$$f(x) = g(h(w(x)))$$

prepared by Razana Alwee

- Let  $f$  dan  $g$  be functions from the positive integers to the positive integers defined by the equations,

$$f(n) = n^2, \quad g(n) = 2^n$$

- Find the compositions

a)  $f \circ f$

b)  $g \circ g$

c)  $f \circ g$

d)  $g \circ f$
